

# How long does it take?

The farmer decides to plough the field in front of you using his tractor. He drives it up and down the field to do this. Each time he passes he ploughs a width of 4 metres.

**Calculate approximately how many times he will have to run his tractor up and down the field.**

**If it takes him 5 minutes to go up the field once, how many minutes would it take him to plough a field like this?**

Ollie's Hint: you can pace out each 4m width.
